

Gruppo 2

Student Burnout & Dropout Risk Dataset

Esplorazione, analisi e modelli predittivi

Presentato da: Antonio, Federica, Massimo, Yuri

- 
- Esplorazione dati con Pandas
 - Dashboard con PowerBi
 - Script di raggruppamento tramite DataBricks e Spark
 - Addestramento e ottimizzazione di modelli predittivi
 - Definizione di un database relazionale con SQL
 - Saluti e ringraziamenti
- 

Indice

Esplorazione dati

Variabili target:

1. Burnout level (High, Medium, Low)
2. Drop out Risk (Yes, No)

Boxplot

Relazioni più significative

Matrice di correlazione

Istogrammi

Diagrammi per anni di studio e arretrati

Grafici a dispersione

Diagrammi delle relazioni a più alta correlazione

Dashboard con PowerBi

01

Pulizia dati

- Sostituzione valori
- Creazione colonne condizionali
- Eliminazione dei valori mancanti

02

Definizione misure

- N. studenti totali
- N. studenti a rischio di drop out
- N. studenti con alto livello di burnout

03

Inserimento grafici di interesse per l'analisi

- Overview sulla composizione dei corsi di laurea
- Focus salute mentale
- Focus livello di motivazione
- Valori utili per l'intervento

Script di raggruppamento tramite DataBricks e Spark

```
from pyspark.sql.functions import *
from pyspark.sql.types import *

path =
"/Volumes/workspace/default/dataset/student_burnout_dropout_data
set_2.csv"

df = spark.read.csv(path, header=True, inferSchema=True)

df_dropped = df.na.drop()    #pulizia del dataset, sono stati
eliminati tutti i null

df_chained = (
    df_dropped.groupBy(col("Department"), col ("Year_of_Study"),
col("Gender"), col("Burnout_Level"))
    .agg(count(col("student_id")).alias("n_student"))
    .sort(col("Department"), col("Year_of_Study"),
col("Gender"), col("Burnout_Level")
))

display(df_chained)
```

Department	Year_of_Study	Gender	Burnout_Level	n_student
Arts	1	Female	High	2
Arts	1	Female	Low	6
Arts	1	Female	Medium	5
Arts	1	Male	High	2
Arts	1	Male	Low	4
Arts	1	Male	Medium	1
Arts	1	Other	High	1
Arts	2	Female	High	3

...

Engineering	4	Male	High	2
Engineering	4	Male	Low	4
Engineering	4	Male	Medium	2
Engineering	4	Other	Low	1
Law	1	Female	High	1
Law	1	Female	Low	3
Law	1	Male	High	2
Law	1	Male	Low	1
Law	1	Male	Medium	1

Machine Learning

01

Definizione della struttura dati e operazioni di etichettatura, pulizia e standardizzazione

02

Implementazione dei principali metodi di classificazione su le due variabili target

03

Valutazione dell'accuratezza del modello e successiva ottimizzazione

Focus sulle operazioni iniziali

1. Importo il dataset

```
df = pd.read_csv('student_burnout_dropout_dataset_2.csv')
df_clean = df.dropna()
df_clean = df_clean.drop(columns=['Student_ID'])
print(df_clean['Dropout_Risk'].value_counts(normalize=True) * 100) #distribuzione della colonna target Dropout_Risk
print(df_clean['Burnout_Level'].value_counts(normalize=True) * 100) #distribuzione della colonna target Burnout_Level
```

2. Trasformazione delle variabili categoriche

```
cat_cols = df_clean.select_dtypes(include='str').columns #seleziono le colonne categoriche
for column in cat_cols:
    le = LabelEncoder()
    df_clean[column] = le.fit_transform(df_clean[column])
```

3. Definizione delle variabili target e esplicative

```
X = df_clean.drop(columns=['Dropout_Risk', 'Burnout_Level']) #rimuovo le colonne target
y_1 = df_clean['Dropout_Risk'] #colonna target per il dropout
y_2 = df_clean['Burnout_Level'] #colonna target per il burnout
```

4. Standardizzazione delle variabili indipendenti

```
scaler = StandardScaler()
X = scaler.fit_transform(X)
```

Focus sui modelli scelti

	Burnout Level	Dropout Risk
Classification Tree		
Random Forest		
SVC		 
Gradient Boosting	 	
Logistic Regression		
KNN Classifier		

3.1

Classification Tree

Accuracy level: 0.69

3.2

SVC

Prima dell'ottimizzazione

Dopo l'ottimizzazione

Gradient Boosting

0 Low 1 Medium 2 High

Prima dell'ottimizzazione

Accuracy level: 0.52

Dopo l'ottimizzazione

Accuracy level: 0.54

Database relazionale con SQL
